

Measuring in the Plane and Space

by

Carrie Klein

This project is for a regular Geometry class studying Area, Surface Area, and Volume. When you look through the next several pages, you will first find the standards I created to determine what information my students would need to know for successful completion of this unit. Next, you will find a standards matrix detailing what standards correspond to each task that the students will complete. Finally, the remaining pages are various activities to assess whether the students have met the standards. With these activities, you will find the criteria that I have used to assess them and how I have assessed them, using either a rubric or an answer key.
