

## **Introduction to Authentic Assessment Project**

This project was designed for use in a Fundamentals of Geometry class, which is a class for high school sophomores and juniors who have historically struggled in mathematics. The class is taught at a slower pace and involves more skill practice than a regular level Geometry class. The following assessments are taken from two different units. One unit involves the study of two-dimensional figures and their properties. In the other unit, students learn how to calculate the area and perimeter of two-dimensional figures.
